

#### Disadvantages of replicaset:

1. Can't perform rollback & roll out.  
Rollback: v1,v2 : v2 is not stable, go back to v1.  
Rollout: v1, can't able to upgrade to v2.
2. Limited flexibility -

Version pod - v1(text msgs)

Upgrade to v2(video call)

For upgrading pod, delete old replicaset, update the code, give apply (creating new replicaset)

#### Deployment:

1. Contains or supports rollout, rollback operations.
2. It will manages replicasets.

d-->rs-->p-->c

3. Self healing, scaling.
4. Stateless - doesn't store data inside pod/container.

Flipkart, redeployment --> meesho.

#### Characteristics:

1. No local storage.
2. Can be deleted anytime.
3. It has the ability of creating new replicaset, replace old pods with new ones, delete old deployments, take control of existing pods, replicasets.

#### Services:

Expose the application with stable IP or stable network.

4 types

1.Cluster IP.

2. Node port
3. LoadBalancer

Cluster IP: securily expose the application.

Default service : cluster IP.

Deployment.yml --> service.yml

Port: host port number

Target port: container port = 5000
