DEVOPS TOOLS-- CI/CD ,CRON JOBS,SERVER

ARGPARSE:-
Argparse is a professional parser used in real applications

Sys.argv	Argparse
Manual handlings	Automatic parsing
No help text	Auto help (-h)
No validation	Auto validation
Not scalable	Perfect for big application

```
import argparse
parser=argparse.ArgumentParser(description="basic example")
parser.add_argument("name",help="Enter your name ")
parser.add_argument("mobile_number",type=int, help="enter your mobile number ")
args=parser.parse_args()
print("name",args.name)
print("mobile",args.mobile_number)
```

Positional arguments:- need to pass the arguments from commandline

Date time modules :-
- Server logs analysis
- Backup automation
- Job scheduling
- CI/CD pipeline timestamp
- Monitoring alerts
- Time zone managements
- Debbing incident

Example :- if server crashed at 2:15 am , you must inspect the logs between 2:00 to 2:20pm
Python module datetime module very essential :

Import datetime ,-->date and time
Import time --> time stamp
Import calendar :--calendar operations

From date and time import datetime
Now=datetime.now()
Print(now)

Strftime()

Code	Meaning
%y	YEAR
%m	Month
%d	Day
%h	Hour
%M	Minutes
%S	Seconds
%A	Weekdays
%B	Month name

```
now=datetime.now()
# print(now.year)
# print(now.month)
# print(now.day)
# print(now.hour)
# print(now.minute)
# print(now.second)
# print(now.strftime("%y-%m-%d"))#sting format time
# print(now.strftime("%y/%m/%d"))
# print(now.strftime("%H:%M:%S"))
# print(now.strftime("%B:%A"))
#time differece
# start=datetime(2026,4,20,15,50,30)
# end =datetime(2026,4,20,18,30,30)
# dif=end-start
# print(dif)
# timedelta --> is a class eith in datetimemodules ,that represents a duration or the
difference between 2 points in time
# now = datetime.now()
# after_5_days= now + timedelta(days=5)
# print(after_5_days)
# import time
# print("starting ")
# print("the name is ............")
# time.sleep(15) # hold the execution time in seconds
# print("Murali  Mohan ")
# import time
# timenow=time.time()
# # convert time stamp:
# print(datetime.fromtimestamp(timenow))
# print(datetime.utcnow())
#weekday check 0--> monday and 1--> sunday
# # today=date.today()
# daycheck=datetime(2026,4,26,15,50,30)
# print(daycheck.weekday())
# import calendar
# for month in range(1,13):
#     print(calendar.month(2026,month))
```

```
Create the banking application:

Deposit
Withdrawal
