

Dockerfile: text document having set of instructions for building or running application.
Without this, docker image is not build.

Why:

1. For building docker --> for running application.
2. Helps u run application in all environments.
3. Steps for deploying application.

Instructions:

1. FROM: compulsory . Node.js --> node:18-alpine, node:20. FROM ubuntu:latest.
2. WORKDIR: optional. Create folder inside container --> storing dependencies, libraries. /app
3. RUN: compulsory. Execute the commands.
RUN apt-get install apache2 -y
RUN cd server
RUN npm node
4. COPY : compulsory. Copy files from local machine to docker.
Copy ./app or COPY . .
5. EXPOSE: port number that is used for exposing application. Compulsory.
EXPOSE 5004
6. CMD: run the application inside the container. Optional.
Override commands.
CMD ["npm", "start"]
7. ENTRYPOINT: not override commands. Excute commands in container. Optional.

FROM
COPY
RUN

EC2 --> update, install web server, clone repo

Docker in ec2 -->update, install docker,

EXPOSE <port1>
