

Virtualization: ubuntu, oracle box.

Types of virtualization:

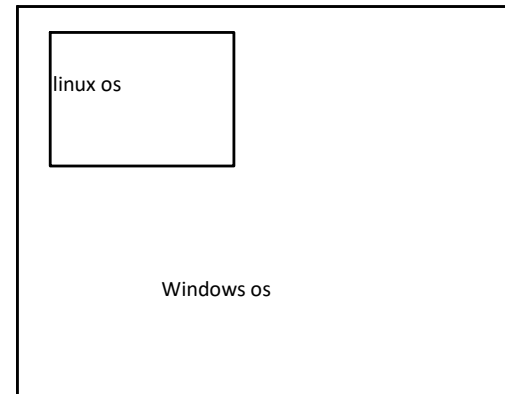

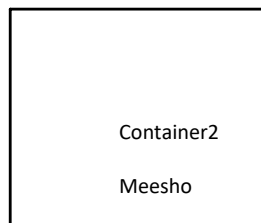

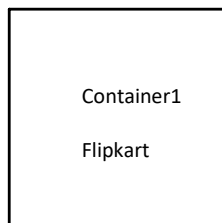

1. Server virtualization --> running multiple servers in same physical machine.
2. OS virtualization --> same os but different tasks, applications. --> docker.
3. Network vz --> create virtual networks.
4. Storage vz --> creating multiple storage devices in one machine.

Containers --> vm of light weight.

It will less configuration(storage, CPU, RAM)

Docker --> it's a containerization tool

2 containers

Advantages:

1. Portability --> even env changes, application should work.
2. Isolated environment.

Docker architecture:

1. Docker CLI (docker client)--> it will take input, shows output.
2. Docker daemon --> execute the command.
3. Docker registry --> stores the images, provides inbuilt image.
Ex: docker hub.
